The Right Tools.

This 1 1/2” SSR installation guide, is the right tool to have at your fingertips. By knowing you have access to all of the right information from proper storage and installation instructions to trim and flashing details, you can be confident installing your Fabral materials.

Use this guide, and call us when further support is needed.

INTRODUCTION

Fabral is the solution for your agricultural applications. We know that your barns and buildings must stand up to all weather conditions and last through the years.

LIGHT COMMERCIAL

For your light commercial needs, Fabral offers metal roofing and siding to match the various building types.

RESIDENTIAL

Homeowners feel proud and confident with Fabral metal roofing for the durability and sophisticated appearance.
You challenge us. And we like it.

Your vision for a building and what you want to achieve makes us think harder. It’d be easy to say - “That won’t work.” Instead we go with - “Let’s see what we can do.” As the leading provider of metal for building envelope solutions, we push the envelope.

We like it when you bring us a problem because we know we’ll find the solution. We have the products, the manufacturing and the know-how. We offer everything you need for the total building envelope solution. At our core, we relish a challenge.

To learn more contact us at 800.477.2741 or Fabral.com.
The information in this booklet has been prepared to assist the designer and installer with the proper application of FABRAL's 1-1/2” SSR roof system. Since each project is unique, the information is intended to be used as a guideline and in no way insures proper application of the 1-1/2” SSR.

Panel Specs:
Substrate: Acrylic Coated Galvalume® Steel
Weight = 130 lbs/sq
Minimum Slope: 1:12
Lengths: Minimum 7” Maximum 47’6”
Panel does NOT endlap - contact Fabral about long length roof runs

PRE-Installation:
Note 1: Lead and copper flashings from existing chimneys, skylights, endwalls and other areas must be removed prior to installation of the new galvanized 1-1/2” SSR. Lead and copper are corrosive when used with galvanized steel.

Note 2: Proper design for attic ventilation for the particular building is the responsibility of the designer, engineer or homeowner, and should comply with local codes. Ventilation design is not the responsibility of FABRAL. With any metal roof system vented soffits, gable vents, and/or ridge vents can be used as part of the overall design.

Note 3: All panels are factory caulked with a 1/8” bead of butyl sealant in the overlapping rib. This caulking may not be visible within 6” of the end of the panels, but can be found inside the overlap rib. Smeared caulking can be removed from the roof with mineral spirits and a soft cloth.

Installation:
1. Check the support system or roof deck to be sure all supports are installed straight, square and in-plane. Solid decking is recommended to help reduce oil canning and for all residential applications. Typically a minimum 1/2” plywood or 2x4 furring is used as support for the 1-1/2” SSR metal roof system. 9/16 OSB or wafer board decking can be used with reduced clip spacing. (Refer to load tables on page 5).
2. Install specified underlayment (such as a minimum 30# felt, Pro-Master UDL, and/or “Ice and Water Shield”).
3. Install the eave trim. As shown in detail.
4. Notch eave of panel 1” and bend the hem under by using the hem-bending tool. Snip off underlap rib flush with the hem edge of the panel pan. Trim and fold overlap rib of panel to provide a clean closed panel rib appearance. Use One-Part Polyurethane sealant on this portion of the rib to provide a weather tight seal. REMOVE the clear strippable film on the painted side of the overlap rib before installing!
5. Starting at the gable end, install the first 1-1/2” SSR panel parallel to the gable with the overlap edge along the gable. Apply tape caulk and place sliding gable cleat over overlap edge and screw down the gable cleat.
6. Install the 1-1/2” SSR clips at the required spacing along the lengths of the panel, using two (2) #10x1” Pancake woodfast screws in each clip. Clips should be spaced a maximum of 24” c/c apart, and may require closer spacing over solid decking. (Refer to load table on page 5).
7. Position the next panel over the under-lap leg. Engage 6” to 12” of the overlapping rib and slide the panel open hem over the nose of the eave flashing. Starting at the eave, apply pressure to the overlap rib until it locks into position. Apply continuous pressure on overlap rib so as to snap it down over the under-lap rib. Do this the entire slope along the length of the panel.

NOTE: On steep pitches it may be necessary to put 1 or 2 fasteners through the pan of the panel, at the top of the panel (ridge/hip/endwall) to prevent the panels from sliding down the roof. Make sure these fasteners are above the area where the top metal Z closure will be placed so they are hidden when finished.
8. Slide panel open hem over the nose of the eave flashing and continue the above procedure across length of the roof.

9. To finish the ridge, first install the top metal Z closures. All closures should be set in sealant, on the pan of the panel to insure proper weather tightness. (Once closures are set, install 3 #14x1” MP screws to fasten through the closure and through the panel, into the decking or purlin. This is critical; these screws hold the panel in place from sliding off of the roof.) One-Part Polyurethane sealants required to be applied behind all closures, up the rib edges, and butyl sealant applied on top of the metal closures, prior to installing the ridge cap flashing or Coravent ridge vent. If installing snowguards on the panels, extra ridge screws must be installed.

10. Follow similar procedures for completing gable, hip and valley conditions.

11. Prior to the end of each workday, all panels and trim should be adequately fastened to prevent any damage due to wind uplift or gravity. See #7 “Note” about securing panel ends at the ridge/hip/endwall.

12. All flashings should be lapped 4” to 6”, sealed with sealant, and stitched together with screws 4” o/c. Flashings should be held in place with continuous cleats or fasteners 16” o/c.

NOTE: Oil-canning can be induced by a variety of conditions, including construction misalignments and is NOT cause for rejection of material. If oil canning occurs, the installation of an ethofoam backer rod under the center of the panels can significantly improve the appearance. INSTALLATION TIP: Even pressure should be applied to the overlap rib to provide a “zip-up” type application when snapping the panels together. This assures that the panel will not kink along the rib as the entire length is being snapped together. Caulking in the rib will not allow moving the panel once it is snapped in place. The hem at the eave should be secured in place prior to locking the panels together.

INSTALLATION GUIDELINES

RECOMMENDED TOOLS & EQUIPMENT
1. Screw Guns
2. 1/4" hex driver
3. 5116" hex driver
4. #2 Combination Squallt/Phillips magnetic drive
5. Extension cords or battery packs and chargers
6. Aviation Tin snips (yellow handle- straight cut)
7. Nibbler - optional
8. Press brake- optional
9. Duck bill metal benders
10. 1-1/2" SSR Bending Tool
11. Hammer and roofing nails
12. Caulk gun
13. Rubber mallet
14. Chalk line
15. Tape measure

PROPER STORAGE
When moisture remains in contact with Galvanized panels in the absence of freely circulating air, white, black or dark gray corrosion products begin to form. Moisture can get between stacked panels either through capillary action or atmospheric humidity. If moisture becomes entrapped between the sheets, this condition can result in water stains or white rust, which can affect the service life of the metal and will detract from its appearance. If the metal panels will not be installed immediately, store them in a well-ventilated, dry area to minimize exposure to moisture. Use wood blocking to elevate the panels at least 1 foot off the ground in an inclined position. This will allow circulation of air between the panels and provide positive drainage. If outdoor storage cannot be avoided, protect the metal with a breathable canvas or waterproof paper cover. Leave the bottom of the cover loose to allow air circulation between the sheets. Do Not use plastic which causes sweating or condensation.

PROPER HANDLING
Panel crates must be lifted at bundle block locations. Center the load on lifting device and do NOT unload in jerking or bouncing fashion. This may cause package to slide on forks and damage panels.

Do NOT lift material with ropes or wires.

Do NOT lift panels greater than 25'-0" long without a spreader bar.

Do NOT lift panels from ends while flat. Lift panels on edge when moving individual panels or when moving onto the roof.

Panels should be lifted and carried on edge with on worker for each 10'-0" of panel.

NOTE: Before installation, remove the clear strippable film that is applied to the painted side of the overlap leg. This film is for transportation protection only, and if left on, will be baked onto the pant finish by the sun.

1 1/2" SSR Panel Profile (varies slightly by region)

Factory Applied Sealant
Shadow Lines Standard; Flat Pan & Stiffening Ribs Available
Step 1

A. Sketch a birds-eye view of the roof and label each section (see example below.)

B. Sketch a diagram of each roof section. Show all measurements (see example below.) It is important to measure the exact center of the ridge to the eave edge. Do not allow anything for overhang.

Additional Information Required: Roof Pitch, Skylights (Location & Size), Chimneys (Location & Size), and Size and Number of Pipe Penetrations.

Step 2

With the information from the diagram you completed in Step 1, you are now ready to complete your roofing panel cut list. Each panel is 16” wide so the only measurement you need is the distance from the eave to the ridge. You can then determine the number of panels needed to cover the length from gable to gable. (See example Diagram A below.)

DIAGRAM A

The length from the eave to the ridge is 12’. The length of the ridge is 25’; therefore, the number of panels to complete one side of the house is 25’ ÷ 1.33’(16”)= 19 pcs. Your materials list should look like Sample B.

SAMPLE B
Section A - 19 pcs. X 12’

Now look at your roof diagram and figure out your next section of roof. Refer back to Diagram A. Section B of this sample roof is the same as Section A. Your materials list should now look like Sample C below.

SAMPLE C
Section A—19 pcs. X 12’
Section B—19 pcs. X 12’

If your home has hips or valleys, refer to Diagram 1A on page 8.
Step 2 (cont.)

DIAGRAM 1A

Start with section A. The eave length is 40’ and the ridge length is 30’, with a difference of 10’. You will need 23 pcs. X 10’ to reach the area where the hip starts. Remember that you have 10’ remaining to cover the area, or 8 more panels. Determine the length of each panel going into the valley by calculating the roof’s pitch. Pitch is how much rise your roof has in inches for every foot of horizontal run. Use the Hip and Valley Chart below to ensure you order the correct panel length for hips and valleys, keeping in mind, that panels are cut to the nearest full inch. For example, Diagram 1A is a 4/12 pitch (4/12p). According to the chart below, we know each panel will be 17” shorter. Since we are measuring from the longest point of the angle, your first piece will be the same length as the full eave to ridge measurement and each piece after will be 17” shorter. (Your list of Section A should look like Sample D on page 9.)

Hip & Valley Chart
When determining the panel length needed for a hip or valley, the panel will either be shorter or longer as you go up or down the hip or valley. The chart below shows you the amount to add or subtract from each panel according to the pitch of your roof.

<table>

Total Lineal Feet of Panels = ________
Total Lineal Feet ______ x 0.0134 = ________ sqs. (Pricing will be based on actual squares shipped)
Squares ______ x 38 clips/sq. = ________ pcs. 1-1/2" SSR Clips (clips included in panel price)
(Note: 38 clips per 100 square feet of panel is based on 24" clip spacing. Closer clip spacing requires purchasing additional clips)
Number of Clips ______ x 2 screws/clip = ________ pcs. Clip Screws #10x1" Pancake Woodgrip
(Transfer to page 2 - #10x1" Pancake Head WG)

Directions: Fill in lineal feet of the various roof conditions. Utilize these numbers in the appropriate spaces below to calculate the total number of pieces needed of each item. If a space doesn't have a number or a zero, it doesn't need to be calculated. Round all piece counts up to the next highest number. Increase all fastener quantities by 10% for drop/loss. Additional accessories are required for endwall, sidewall or transition details.

* Round all fastener quantities to nearest 100 pcs.

NEW ROOF APPLICATION

1. Make sure there are no nails or other objects protruding from the substrate that might puncture the underlayment or damage the roof panels. Clean all debris from the deck.

2. Check all details for possible roof penetrations which must be added to the deck prior to roof panel installation (vented ridge for example).

3. Cover the entire roof deck with 30-pound felt paper, or better (we consider any synthetic to be better) (hereinafter referred to as underlayment). Begin at the eave at the gable end and roll out the underlayment horizontally (parallel to the eave). Allow each consecutive course to overlap the previous one by 4-6”. Overlap the end a minimum of 6” when starting a new roll of underlayment. Areas of underlayment that have been torn or cut should be replaced or repaired prior to installation of the metal roof. (See Illustration #1 below) Ice & Water shield should be used in cold climates starting at the eave and extending at least 24” past exterior walls. If using 30 lb felt, use rosin paper as a slip sheet between roof panels and felt paper.

4. Place an alignment line along the gable end where the first roof panel will be installed. THIS LINE MUST BE LOCATED 1/2” IN FROM THE GABLE EDGE OF THE ROOF DECK AND SQUARE WITH THE EAVE LINE. Various methods exist for ensuring that the line is square. Call your nearest FABRAL representative if you need assistance. (See Illustration #2)

ILLUSTRATION #1

ILLUSTRATION #2
EXISTING ROOF
APPLICATION

In many cases, FABRAL’s 1 1/2” SSR Panels can be installed over existing roofing.

Some jurisdictions will allow retrofit over certain types of roofing without tear-off of the old roofing. For best results, always use furring strips and 30 lb. felt paper over old shingles. Furring strips can be installed 12” o.c. with 1 1/2” SSR to provide adequate panel support and wall capability. Check with your local codes or building department for the specific requirements in your area.

If the roof is to be stripped down to the existing decking, follow the procedures for new roofs on page 13. Be sure to check the existing roof and repair any damaged areas prior to installation of the new roof system.

The following steps should be taken when installing 1 1/2” SSR roof panels over existing roofing.

• Inspect the roof for damage and make the necessary repairs.
• Secure any warped or loose roofing material.
• Make sure there are no nails or other objects protruding from the roof that might puncture the new underlayment or damage the new roof panels.
• Remove all moss and other debris from the roof.
• Cut off any overhanging roofing flush with the roof deck, and remove all hip and ridge caps.
• Follow the directions on page 13, #2 through #4, on roof preparation.

Note: For best results, 1 1/2” SSR Roofing requires a relatively smooth and flat substrate. Application over rough and/or uneven surfaces is not recommended, as this will cause oil-canning.

PANEL INSTALLATION

Note: Prior to panel installation, determine which items need to be installed prior to panels (such as vent screen, eave, valley, swept wing, etc.)

1. Install eave trim.
2. Working off the eave edge, establish a straight line up the gable edge from which you are starting. This will insure that the first panel laid will be straight and square with the eave. (See Illustration #2 – page 13)
3. Before fastening the panel to the roof deck, hem 1” of the panel 180deg. (or allow a 1” overhang to attach an angle piece to the eave when using WEF4 alternate eave detail).
4. Once the first panel is in proper position, secure it to the roof deck with the proper fasteners along the screw flange (#10 x 1” Waferhead panel screw on 12” centers maximum.)
5. Install the gable trim and face screw it to fascia board (see page 21). This fully secures the first panel to the roof.
6. Position the second panel (overlap edge on top of the underlap edge of first panel) assuring that the eave edge is in position (1” overhang). Secure the second panel to the first panel by applying slight pressure on the overlap seam (or use rubber mallet) working from the eave toward the ridge. The overlap edge of the panel contains factory-applied sealant to ensure weathertightness. Be sure that you achieve a positive engagement between panels. Fasten the panel to the roof as in step #3 above.
7. Each consecutive panel will be applied as in step #3 and #5 above.
# FASTENERS

## Recommended fasteners for the proper installation of 1 1/2” SSR panels

<table>

## #9-16 WoodFast
- Use with dimensional lumber
- Available in 1”, 1 1/2”, 2”, 2 1/2” and 3”
- 1/4” hex head, EPDM/metal washer
- Oxyseal Long-Life Coating
- Plain or Painted
- 250/bag

## #12 x 3/4” Stitch Screw
- Used for attachment of trim to top of seam for screw flange panels
- Use with STEEL panels
- Used to stitch sidelaps for exposed fastener panels
- Used for miscellaneous metal to metal attachments
- 1/4” hex head, EPDM/metal washer
- Plain or Painted
- 250/bag

## #14-10 WoodTite
- Use to fasten metal to plywood or OSB
- Use for trim attachment
- Available in 1”, 1 1/2”, and 2”
- 5/16” hex head, EPDM/metal washer
- Oxyseal Long-Life Coating
- Plain or Painted
- 250/bag

## #43 Pop Rivet
- Use for attaching trim to closures
- Available in 1”, 1 1/2”, and 2”
- Plain or Painted
- 250/bag

## Proper Installation of Gasketed Fasteners
- Correctly driven
- Under driven
- Over driven

## SYSTEM COMPONENTS & ACCESSORIES

- **1 1/2” SSR 150**: 2 Pancake Head Screws per Clip
- **Top Metal Z Closure 16” Long**: Ridge Cap Anchor Clip
- **Coravent V-400 Ridge Vent**: Profile Vent
- **Pipe Boot**
STANDARD 1 1/2” SSR

FLASHINGS & TRIMS

All flashing is 10’ 6” in length & available in steel.

WRH1
Ridge/Hip

Eave Hem
Bending Tool

Mod WTF1
Gambrel

WTF1
Transition
Step 1

TWO-PIECE EAVE TRIM
(Use when roof pitch is greater than 6:12)

ONE-PIECE EAVE TRIM
(Use with roof pitches up to 6:12)

1. Line WEF2 or WEF1 top in line with plywood/purlin.
2. Screw at 12” o.c. across face of trim.

Step 2

3. Hook WEF3 over hem entire length.
4. Tack in place with roofing nail.
5. Extend felt over eave trim.

Step 3

6. Mark 1” in pan of panel and cut beside each rib with a tin snips.
7. Use bending tool to bend hem under the panel.
8. Cut underlap leg off completely for 1”
9. Cut overlap leg as shown on angle Cut to produce a triangular piece to fold, closing the open rib.

Step 4

10. Caulk with One-Part Polyurethane up underlap leg.
11. Slide panel over eave hem, tight (in cold weather) or with gap (in warm weather). Snap panels together by applying pressure to the panel rib. Start at the eave and work toward the ridge.
12. A single #14x1” MP fastener can be used near the ridge to hold the panel in place. (This fastener must be installed above the location where the Z closure will be located, not to interfere with the closure.)
13. Panel clips can now be installed on this panel using 2 #10x1” Pancake head screws. Place the first clip near the edge of the substrate as shown in detail.

FABRAL 1 1/2 SSR SERIES PANEL

PLYWOOD DECK, BY OTHERS

View installation videos at Fabral.com/videos
1. Place Butyl Tape caulk in pan of panel.
2. Press Metal Zee Closure firmly into caulk bead in pan of panel.
3. Screw fasten closures into panels and purlin/deck using 3 #14 screws per closure UPSLOPE of caulk bead.
4. Use One-Part Polyurethane sealant up the back side of the vertical web of closures along the panel ribs and over top flange to seal gaps.
5. Hook ridge/hip flash open hem over Metal Zee closure top flange and secure over other side of Zee.
6. Screw both sides every 12” o.c.

**IMPORTANT NOTE FOR RIDGES (VENTED AND NON-VENTED)**
The 1 1/2” SSR panel system is allowed to expand and contract from thermal differences, by the panel sliding in the clips. This makes the 1 1/2” SSR a TRUE standing seam system. The ridge/hip must be fastened securely through the Top Metal Z Closure/WHC1, through the panel and into the roof decking/purlin with 3 #14x1w Mill Point screws per panel. If these fasteners are omitted the panels may slide off the roof after installation. The eave is hemmed to allow the panels to move thermally at the eave without disengaging. If installing snowguards, double the ridge anchor screws.
VENTED RIDGE

CoraVent
1. Place Butyl Tape caulk in pan of panel.
2. Press Metal Zee Closure firmly into caulk bead in pan of panel.
3. Screw fasten closures into panels and purlin/deck using 3 #14 screws per closure UPSLOPE of caulk bead.
4. Use One-Part Polyurethane sealant up the back side of the vertical web of closures along the panel ribs and over top flange to seal gaps.
5. Screw CoraVent to top of zee closure using #10 x 1 1/2” Woodfast screws.
6. Screw both sides every 12” o.c.

Profile Vent
1. Install panels with top edge approximately even with opening in plywood using 2 #14x1” MP fasteners in the panel flat next to each rib. (Do not place a fastener in the center of the panel at this time.)
2. Roll Profile Vent out across the ridge.
3. Place sealant under the bottom leg (leg with access hole) of ridge cap anchor clip.
4. Place anchor clip in center of panel flat, so the vertical part of the lower leg is approximately 31/2" from the top of the panel. (refer to diagram)
5. Fasten lower leg with 1 #14x1 MP into the panel using the access hole in the clip (repeat for all panels at ridge).
6. Lift the upper leg of the anchor clip and slide the profile vent under the anchor clip.
7. Place sealant under the anchor clip of the upper leg of the anchor clip and fasten the upper leg using the #14x1” MP. Repeat these steps on both sides of the ridge.
8. Fasten ridge cap using one #14x1” MP through the ridge cap and into the anchor clip (refer to detail)

Note: For vented ridge, figure 2 #10x1” woodfast screws for every 1 foot of ridge. CoraVent may need to be cut to fit correctly. For pitches greater than 12/12, contact Fabral.

VIEW INSTALLATION VIDEOS AT FABRAL.COM/VIDEOS
**KEY TERMS**

See page 16 for Illustration of Trim Conditions

**Key Terms**

**CHIMNEY OR SKYLIGHT**
See pages 29-31.

**EAVE TRIM**
This piece is used at the eave or gutter edge of the building, and must be installed before any panels.

**ENDWALL**
This piece is used when the upper end of panel butts into a vertical wall.

**HIP CAP**
This piece covers projecting angles formed at the intersection of the two sloping roof planes.

**FASTENERS**

- **3/4” Stitch Screw**: This fastener is used to attach two pieces of metal to each other.
- **#14 x 1” Mill Point**: This fastener is used to fasten into panel near ridge, and can also be used for secure flashings and pipe boots.
- **#9 x 1” WoodFast**: This fastener is used to fasten flashing to fascia boards at eave or gable.
- **#10 x 1” Pancake Head Screw**: This fastener is used to fasten the clip to the roof deck.
- **#43 Pop Rivet**: This fastener is used to attach trim to metal closures.

**GABLE TRIM**
This piece is installed on the house between the ridge and the eave, holding down the first panel edge and the last panel edge.

**GAMBREL CONDITION**
This trim is used to transition from a low slope on the upper roof to a steep slope on the lower roof.

**MONOSLOPE RIDGE**
This piece is used at the top of a single sloped roof.

**RIDGE CAP**
This piece is used at the peak of the roof. The ridge can be ventilated by leaving the foam closure out.

**SIDEWALL**
This piece is used when the roofing panel is installed parallel to a vertical wall.

**SLOPE TRANSITION**
This piece is used where two roofs of different pitch meet; the top section being steeper than the lower section.

**W-VALLEY**
Used to flash the valley formed by intersecting roof planes.
Enduracote® is a paint system that takes performance to the next level. Based on cutting edge resin technology, this system offers unbeatable durability and superior long-term performance against the elements.

The Enduracote® Warranty for Galvalume® Panels
- Lifetime film integrity for walls & roofs
- 30-year against fade & chalk for walls and roofs
- 20 year non-perforation warranty

For profiles: Grandrib 3, 1 1/2" SSR, Climaguard, Mighti-Rib, Horizon S, Horizon 16, Ultra-Loc, Ultra-Rib

Product Warranties are available upon request

The ENERGY STAR® Program promotes highly reflective roof systems that reflect solar energy. These roof systems allow buildings to stay cooler and, in turn, use less electricity for air conditioning; less electricity means a reduction in power generation and a reduction of pollutants discharged at power plants. Fabral has attained ENERGY STAR approval for many of its Enduracote® system colors. Ask for Technical Bulletin #724 titled “ENERGY STAR Approval”, for program details and a list of approved Enduracote® colors.

All Fabral Enduracote Colors are ENERGY STAR® Approved

Please contact your Fabral representative for more information about Fabral warranties and paint systems.
